

Dynatrace

22. Juli 2026

Dear Dynatrace Recruiting Team,

I am excited to apply for the position of Senior Full-Stack Engineer, Backend Focus. The opportunity to contribute to an AI-first platform that enables autonomous agents to perform complex engineering tasks strongly matches my experience in building scalable software systems, production-grade AI applications, and reliable backend solutions.

I have more than nine years of experience developing software systems across different domains, including Enterprise Search, Computer Vision, and safety-critical industrial applications. Throughout my career, I have focused on designing maintainable architectures, improving system performance, and building reliable software components for demanding production environments. My main technologies are Python and C++, complemented by experience with distributed systems, automation, Linux-based environments, and modern software development practices.

In my current role at Mindbreeze, I develop scalable backend components, automated workflows, and data-processing solutions for an enterprise search platform. My work includes building reliable processing pipelines, integrating distributed services through APIs, improving system performance, and contributing to architectural decisions. This experience has strengthened my understanding of building robust enterprise platforms with reliable data processing and predictable production behavior.

Previously, at EYYES, I developed and deployed deep-learning-based computer vision systems for safety-critical real-time applications. I built machine-learning pipelines, integrated AI models into production environments, and optimized inference systems regarding performance and reliability. This experience gave me practical insight into the challenges of deploying AI solutions beyond experimentation and into dependable production systems.

I am particularly interested in Dynatrace's approach of building secure AI-driven engineering platforms. My background in production AI systems, enterprise backend development, and safety-critical software has shown me the importance of reliable system boundaries, secure design, and predictable behavior when developing intelligent systems at scale. I enjoy solving complex technical challenges, evaluating architectural trade-offs, and building solutions that are both innovative and production-ready.

I hold a Master's degree in Scientific Computing from the University of Vienna, where I focused on algorithms, numerical methods, and high-performance computing. This background has strengthened my analytical approach and my ability to understand and optimize complex computational systems.

I would welcome the opportunity to bring my experience in backend engineering, AI systems, and scalable software development to Dynatrace and contribute to building the next generation of AI-driven engineering platforms.

Kind regards,

Markus Gruber
